$$(1-r) \cancel{a} = (1-R) \cancel{2a}$$

$$1-r = (1-R)2$$

$$1-r = 2 - 2R$$

$$-r = 1 - 2R$$

$$r = -1 + 2R$$

$$\underline{r = 2R - 1} \quad \text{QED}$$

It is now given that the 3rd term of the first progression is equal to the 2nd term of the second progression.

(b) Express S in terms of a .

[4]

u_3 of first progression:

$$u_3 = ar^2 \quad (1)$$

u_2 of second progression:

$$u_2 = aR \quad (2)$$

$$(1) = (2):$$

$$ar^2 = aR$$

$r = 2R - 1$ (from part (a)):

$$a(2R-1)^2 = aR$$

$$(2R-1)^2 = R$$

$$4R^2 - 4R + 1 = R$$

$$4R^2 - 5R + 1 = 0$$

$$(4R-1)(R-1) = 0$$

$$R = \frac{1}{4} \text{ or } R = 1$$

Sub. into $2S = \frac{a}{1-R}$ from part (a):

$$R = \frac{1}{4}: 2S = \frac{a}{1-\frac{1}{4}}$$

$$R = 1: 2S = \frac{a}{1-1}$$

$$2S = \frac{a}{\frac{3}{4}}$$

$$= \frac{a}{0} \quad \times$$

$$2S = \frac{4a}{3}$$

$$\underline{\underline{S = \frac{2a}{3} \quad \checkmark}}$$

- 9 The second term of a geometric progression is 16 and the sum to infinity is 100.

(a) Find the two possible values of the first term.

[4]

$$U_2: ar^1 = 16 \quad (1)$$

$$S_{\infty}: \frac{a}{1-r} = 100$$

$$a = 100(1-r) \quad (2)$$

Sub. (2) into (1):

$$100(1-r) \times r = 16$$

$$100r - 100r^2 = 16$$

$$100r^2 - 100r + 16 = 0$$

$$25r^2 - 25r + 4 = 0$$

$$r = \frac{-(-25) \pm \sqrt{(-25)^2 - 4(25)(4)}}{2(25)}$$

$$\underline{r = \frac{4}{5}} \quad \text{or} \quad \underline{r = \frac{1}{5}}$$

Sub. into (1):

$$\underline{r = \frac{4}{5}}: a \times \left(\frac{4}{5}\right) = 16$$

$$\underline{r = \frac{1}{5}}: a \times \left(\frac{1}{5}\right) = 16$$

$$\underline{a = 20}$$

$$\underline{a = 80}$$

- (b) Show that the n th term of one of the two possible geometric progressions is equal to 4^{n-2} multiplied by the n th term of the other geometric progression. [4]

progression with $a = 80$ and $r = \frac{1}{5}$:

$$u_n = 80 \times \left(\frac{1}{5}\right)^{n-1}$$

$$= 80 \times \left(\frac{1}{5}\right)^n \times \left(\frac{1}{5}\right)^{-1}$$

$$= 80 \times \left(\frac{1}{5}\right)^n \times 5$$

$$= \underline{400 \times \left(\frac{1}{5}\right)^n}$$

progression with $a = 20$ and $r = \frac{4}{5}$:

$$u_n = 20 \times \left(\frac{4}{5}\right)^{n-1}$$

$$= 20 \times \left(\frac{4}{5}\right)^n \times \left(\frac{4}{5}\right)^{-1}$$

$$= 20 \times \left(\frac{4}{5}\right)^n \times \frac{5}{4}$$

$$= 25 \times \left(\frac{4}{5}\right)^n$$

$$= 25 \times 4^n \times \left(\frac{1}{5}\right)^n$$

$$= \frac{400}{16} \times 4^n \times \left(\frac{1}{5}\right)^n$$

$$= \frac{400}{4^2} \times 4^n \times \left(\frac{1}{5}\right)^n$$

$$= 400 \times 4^{-2} \times 4^n \times \left(\frac{1}{5}\right)^n$$

$$= 400 \times 4^{n-2} \times \left(\frac{1}{5}\right)^n$$

$$= \underline{4^{n-2} \times \left(400 \times \left(\frac{1}{5}\right)^n\right)}$$
